

## **Learning is a Year-round Adventure**

No one likes boring, especially children who learn best in stimulating settings with a dose of fun mixed into the learning.

Providing stimulating opportunities allows a child to understand objects and problems, process the information, and remember the occurrences so they can build on the concepts for the next problem solving adventure.

- The young child likes to build structures with blocks and knock them down.
- The older child enjoys exploring the physical world with simple gears and tools, math and science, and language.
- All children enjoy puzzles and books, role playing and performing, creating art, communicating with others, and showing off what they know.

Here's what helps cement the learning experience for children:

- Repetition of the new concept
- Active participation
- Talking and playing with parents and caregivers

The Children's Museum encourages parents/caregivers and children to talk, play, and learn together. You can help your child get started on a life-long adventure of learning at the Children's Museum as you both explore how simple machines work, how structures are designed, and the creative process of art.

Remember, a supportive environment allows children to learn languages, cause and effect, numbers and simple math, relationships, similarities and differences, matching, and sequencing, all vital skills needed for a successful new school year.
